

## Radialgram Rotation

The Rotation option will rotate the diagrams by the specified number of degrees (positive or negative). The intent is to provide a tool for minimizing annotation overplotting when overlaying maps. For example, in the diagram shown below, the red polygon (PFUnA, PFDA, PFNA, etc.) has been plotted with a Rotation setting of zero while the blue polygon (PFCA, PFSA, PreM, PreS) has been rotated 15 degrees such that the blue labels don't overplot the black labels.
